The Cleanscape GUI interface mode delivers powerful and comprehensive analysis from a couple mouse clicks, cutting hundreds of hours from design, debug, or test.

In this era of large, complex Fortran code – often using OpenMP and/or MPI, often collaborative between industry, government, and educational institutions – Flint provides fast, flexible, yet *powerful* analysis to help you produce code that is bug-free, runs as expected for all inputs, and is free from weaknesses to security threats.

Cleanscape FortranLint (*Flint*) is a static source code analyzer that automatically identifies problems at their source, prior to compiling or executing. From its first use, this tool can save you hours and hours of tedious debugging, and greatly reduces the resources required for testing – both development and integration phases.

Flint rigorously examines source files both individually and as a project, almost instantly generating comprehensive and meaningful reports on problems often overlooked by Fortran compilers.

A free demo is available on Linux, Windows, and Mac hosts. For more information or to order, call or visit our website today!

Flint's Visual Studio integration mode makes running static analysis simple and convenient. With three distinct user interface modes, one will be right for you!

Key Features

Feature	Description
KEY LINT ANALYSIS OPTIONS (out of 39	major controls)
-g Global mode	Perform Whole Program Analysis to detect errors between modules and
	track data values across interface boundaries
-w, -f, -m	Control the depth of analysis to be performed: add warnings,
	informational (FYI) and implicitly typed variables
-o "format"	Specify analysis message format for use with IDEs like Visual Studio
-p invoke Preprocessor and	Use a C or Fortran preprocessor. Flint will automatically invoke
'-# <path> Specify Preprocessor Path</path>	preprocessor for filenames with capitalized extensions (e.g., .F, .F90)
REPORT OPTIONS	
Cross Reference (xref)	Show symbols used throughout entire program with usage info (e.g.,
	set/reference, allocated), source file, procedure, and line number.
	Extensive filtering options (e.g., omit probable loop counters)
Call Tree	Structural diagram of the "call" structure used by the source code. Extremely useful for code familiarization and documentation
Include Tree (GUI)	Show where INCLUDE and #include have been used to include additional source content – make sure you're using the right version
External Editor (GUI)	Select the external code editor to be invoked when clicking a hyperlink.
· · · ·	External program 'seteditor' can add your own editor to the dropdown list
Statistics	File counts, symbol types/counts, and message counts/summary
INNOVATIVE CODE ANALYSIS	
WPA Filtering	See results for the files you're updating in the context of the whole
	program. Filtering provides maximum information about these files while
	screening out 99+% of the WPA which is not relevant to your work at
	hand. See the Benchmark section below for an example.
Dataflow Analysis	Detect dead code
	Detect reference-before-set issues for all branches of conditional
	constructs and forward GOTOs
Fileset dependency analyzer	For a given UUT, what is the minimum set of files necessary to resolve USE, INCLUDE, and #include dependencies? Necessary for local-mode
	analysis of specified UUT(s) and critical to successful dataflow analysis
Security and anti-hacking analyses	Analyses to detect coding practices that leave code vulnerable, such as
	bounds checking. An enhanced Flint is included with CASAF,
	Cleanscape's CWE Analyzer, available separately.
Powerful yet intuitive graphical interface	Fast and interactive environment overlays powerful Flint command line
(included)	engine to control four innovative analyses, and hyperlinking to source
	using your external programming editor.
OpeniviP analysis (option)	Race conditions and deadlock
	Misplaced directives, nested blocks, modify outside critical section
RENCHMARK	xrei: Usage into tor parallel regions; private/shared attributes
DENCENNATION	Quantum chomistry solver a 331 files a 65MB of source a 1 5MLOC
Analysis Time	36.0 sec on guad-core i7 Windows 7 workstation with 16 GR memory
Working set (memony) size	37.6 MB
Unfiltered results initial whole program run	1 494 904 lines
Includes complete analysis full cross	- 911 772 lines were the cross reference
reference, call tree, statistics	- 181297 were the call tree
Filtered results for whole program single	3611 lines
UUT sourcefile	- 2886 lines were the cross reference. 87 were the call tree
Key Benefit	0.242% filted/unfiltered lines
	Only 581 analysis lines to review (out of 459.997)
